Kinematics describes the motion of robot links and joints without considering forces. MATLAB offers several approaches:

- Denavit-Hartenberg (D-H) Parameters:** A systematic way to model robot arms, widely used for serial manipulators.
- Rigid Body Tree Representation:** MATLAB's `rigidBodyTree` class provides a flexible structure to define complex robots with multiple joints and links.

Example: Building a 6-DOF Robot Arm

```
matlabrobot = rigidBodyTree;% Define links and joints
for i = 1:6
    body = rigidBody(['link', num2str(i)]);
    joint = rigidBodyJoint(['joint', num2str(i)], 'revolute');
    setFixedTransform(joint, dhparams(i, :), 'dh');
    body.Joint = joint;
    if i == 1
        addBody(robot, body, 'base');
    else
        addBody(robot, body, ['link', num2str(i-1)]);
    end
end
```

This code initializes a robot model, defining links and joints based on DH parameters, which can be customized to match physical specifications.

Dynamic Modeling

Dynamic modeling incorporates forces and torques, enabling the simulation of actual movement under various loads and control inputs. MATLAB's Robotics Toolbox supports dynamic analysis through functions like `inverseDynamics` and `forwardDynamics`. ```

matlab% Define waypoints
waypoints = [0.5, 0.2, 0.3; % Position of pick point
0.8, 0.2, 0.3; % Position of place point
0.5, 0.2, 0.3]; % Return position
% Generate joint configurations for path
[q, qd] = ikinePath(robot, waypoints);
% Animate the robot along the path
for i = 1:length(q)
show(robot, q(:, i), 'Frames', 'off', 'PreservePlot', false);
drawnow;
end

```

This script demonstrates path interpolation and visualization, enabling developers to verify motion plans before physical implementation. matlab ik = inverseKinematics('RigidBodyTree', robot);
[configSol, info] = ik(endEffector, targetPose, weights, initialGuess);

```

% Create message
msg = rosmessage(jointPub);
msg.Name = {'joint1', 'joint2', 'joint3', 'joint4', 'joint5', 'joint6'};
