Detailed Solutions and Explanations for Singapore Junior Physics Olympiad 2012

Below is a structured overview of typical questions from the 2012 SJPO along with detailed solutions and explanations. The actual questions vary, but this guide captures the essence of common problem types.

Sample Question 1: Kinetic Energy and Motion

Question: A car accelerates from 0 to 20 m/s over a distance of 100 meters. Assuming constant acceleration, calculate:

- The acceleration of the car.
- The kinetic energy gained by the car during this acceleration.

Solution:

- Using the equation of motion: $v^2 = u^2 + 2as$ where $v = 20 \text{ m/s}$, $u = 0 \text{ m/s}$, $s = 100 \text{ m}$. Rearranged for a : $a = \frac{v^2 - u^2}{2s} = \frac{(20)^2 - 0}{2 \times 100} = \frac{400}{200} = 2 \text{ m/s}^2$
- Kinetic energy gained: $KE = \frac{1}{2} m v^2$ Since mass (m) is not specified, the answer is in terms of (m) : $KE = \frac{1}{2} m \times (20)^2 = 200m \text{ J}$

Key Takeaway: The acceleration is 2 m/s^2 , and the kinetic energy acquired is $(200m)$ Joules.

Sample Question 2: Light and Optics

Question: An object is placed 30 cm in front of a convex

lens with a focal length of 15 cm. Find the position and nature of the image formed. Solution: Using the lens formula: $\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$ where $(f = 15\text{ cm})$, $(u = -30\text{ cm})$ (object distance is negative for real objects). Calculating: $\frac{1}{v} = \frac{1}{f} + \frac{1}{u} = \frac{1}{15} + \frac{1}{-30} = \frac{2}{30} - \frac{1}{30} = \frac{1}{30}$ Thus: $v = 30\text{ cm}$ Interpretation: The positive value of (v) indicates the image is real and on the same side as the object. The image is located 30 cm from the lens, real, inverted, and of the same size as the object. Key Takeaway: The image forms at 30 cm, real, inverted, and of equal size.

Sample Question 3: Electricity and Magnetism Question: A 12 V battery is connected across a resistor of resistance 6 Ω . Calculate: a) The current flowing through the resistor. b) The power dissipated in the resistor. Solution: a) Using Ohm's Law: $I = \frac{V}{R} = \frac{12}{6} = 2\text{ A}$ b) Power dissipated: $P = V \times I = 12 \times 2 = 24\text{ W}$ Key Takeaway: The current is 2 A, and the resistor dissipates 24 W of power.

How to Access the Official 2012 Answers Students and teachers seeking the official answer keys for the Singapore Junior Physics Olympiad 2012 can find them through several channels:
