Key Concepts and Theorems in Chapter 12 with Sample Problems
Properties of Circles
Radius and Diameter: The radius is the distance from the center to any point on the circle; the diameter passes through the center, with length twice the radius.
Chord: A segment with both endpoints on the circle.
Tangent: A line that touches the circle at exactly one point, perpendicular to the radius at the point of contact.
Secant: A line that intersects the circle at two points.

Major Theorems and Definitions
Inscribed Angle Theorem: An inscribed angle is half the measure of its intercepted arc.
Central Angle Theorem: The measure of a central angle equals the measure of its intercepted arc.
Angles Formed by a Tangent and a Chord: The measure of the angle is half the measure of the intercepted arc.
Chord-Chord Angles: The angle formed outside the circle by two intersecting chords equals half the difference of the intercepted arcs.
Secant-Secant and Secant-Tangent Angles: These angles are related to the measures of intercepted arcs and segments.

Sample Problem and Solution
Problem: In a circle, a tangent and a chord intersect at point P outside the circle. If the measure of the angle formed between the tangent and the chord is 40° , find the measure of the intercepted arc.
Solution Steps:
 Recognize that the angle between a tangent and a chord is half the measure of the intercepted arc.
 Set up the equation: $\text{Angle} = \frac{1}{2} \times \text{Arc measure}$
 $40^\circ = \frac{1}{2} \times \text{Arc measure}$
 Solve for the arc measure: $\text{Arc measure} = 2 \times 40^\circ = 80^\circ$
Answer: The intercepted arc measures 80° . This sample illustrates how understanding the theorems simplifies problem-solving, which can be cross-verified with the answer sheet.
